

TROUBLESHOOTING

The following simple issues can be handled by the user.
Please call the after-sale service department if the issues are not solved.

Problem	Possible Causes
Water Line Inspection	<ul style="list-style-type: none">• Main control panel terminal• Water valve terminal• Ice-maker inspection• Water dispenser inspection

MAIN CONTROL PANEL TERMINAL

First, check if there is an issue with the water line.

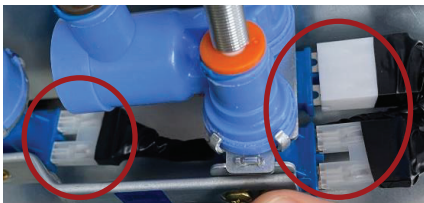

Next, check the terminal connections. They must be firmly inserted.

The terminals need to be inserted until you hear a clicking sound, indicating that they are properly locked in place.

WATER VALVE TERMINAL

Check the following three items for the water valve, located at the bottom:

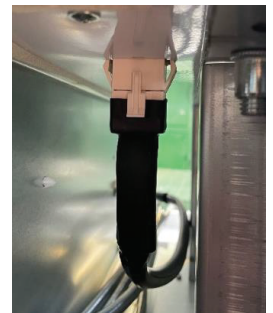

1. Water valve assembly

2. Connection wire terminal

3. Water valve terminal

ICE-MAKER INSPECTION

Check the following three main items for the ice-maker:

1. Ice-maker power cord

2. Ice-maker income water tube defrost heater terminal

If the ice maker stops working after a few days or months, it might be blocked by ice inside the tube. This issue may be caused by a malfunctioning defrost heater.

The terminal is located at the back of the unit.

3. Ice-maker income water tube position

If the plumbing is twisted, the ice maker won't receive water.

The water pipe needs to extend through the hole to ensure a proper water supply.

WATER DISPENSER INSPECTION

Check the following two items for the water dispenser:

1. The water dispenser valve terminal is located in the fridge cabinet, on the backside of the vent cover.

2. Water dispenser switch.
